Time on Page vs Revenue: Brief Report

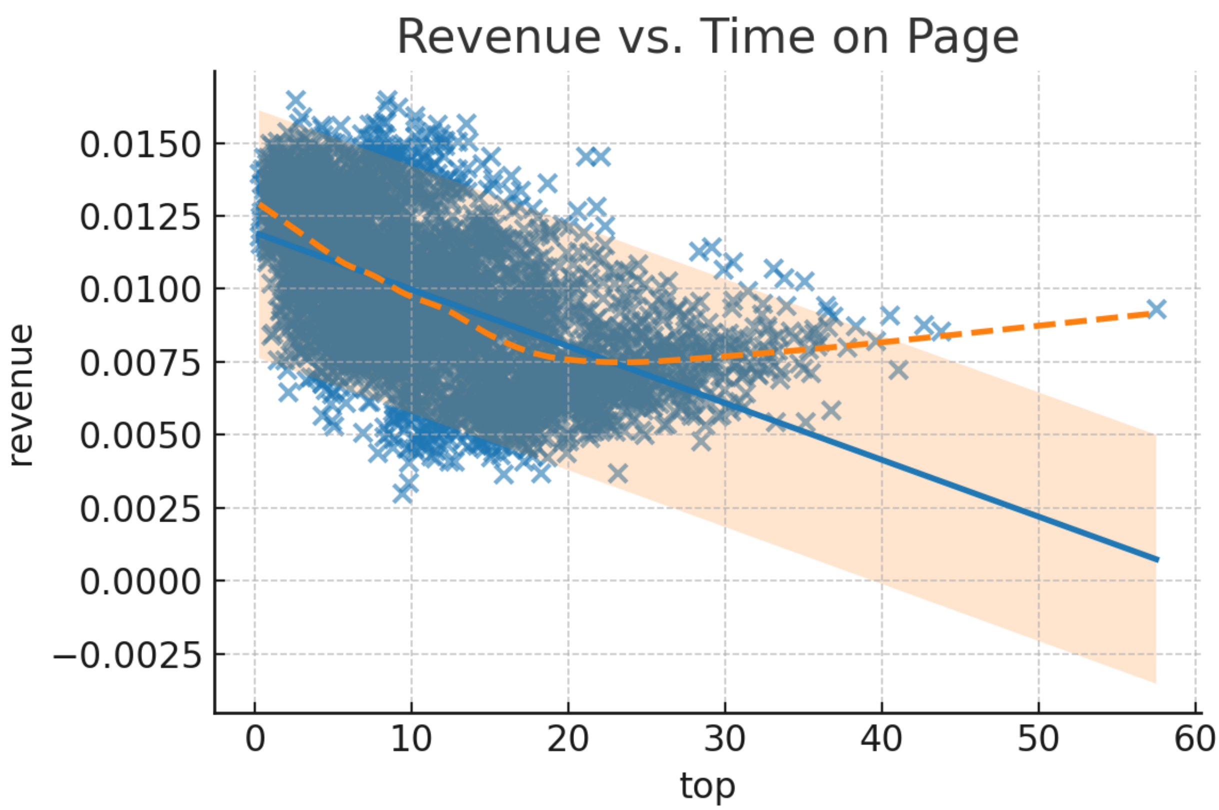
Dataset size used: 4,000 rows.

Key Findings

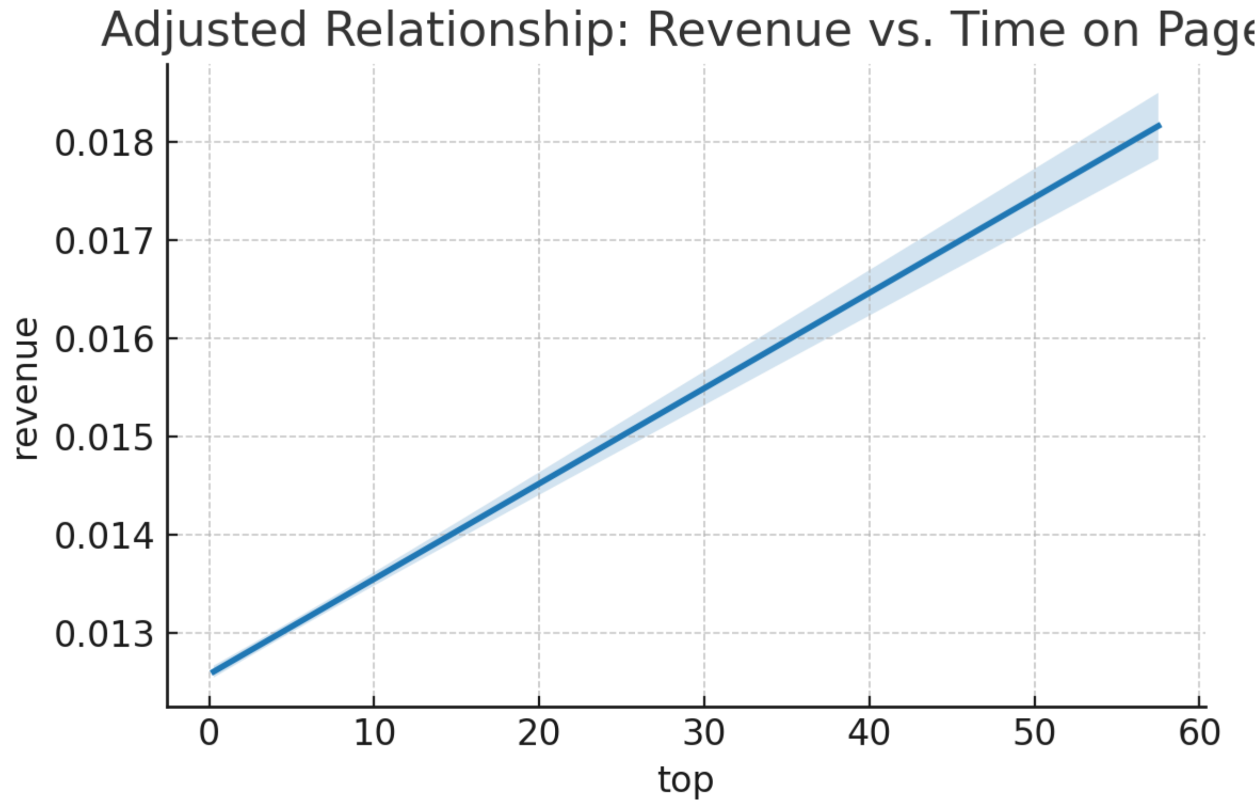
• Simple association: Pearson r = -0.555; Spearman ρ = -0.608 (p=0).
• Univariate fit (revenue ~ time): slope = -0.000195 (SE 4.85e-06, 95% CI [-0.000204, -0.000185], p=0).
• Standardized effect (both variables z-scored): β = -0.555 (p=0).
• Adjusted standardized effect: β = -1.14 (p=0).

Visuals

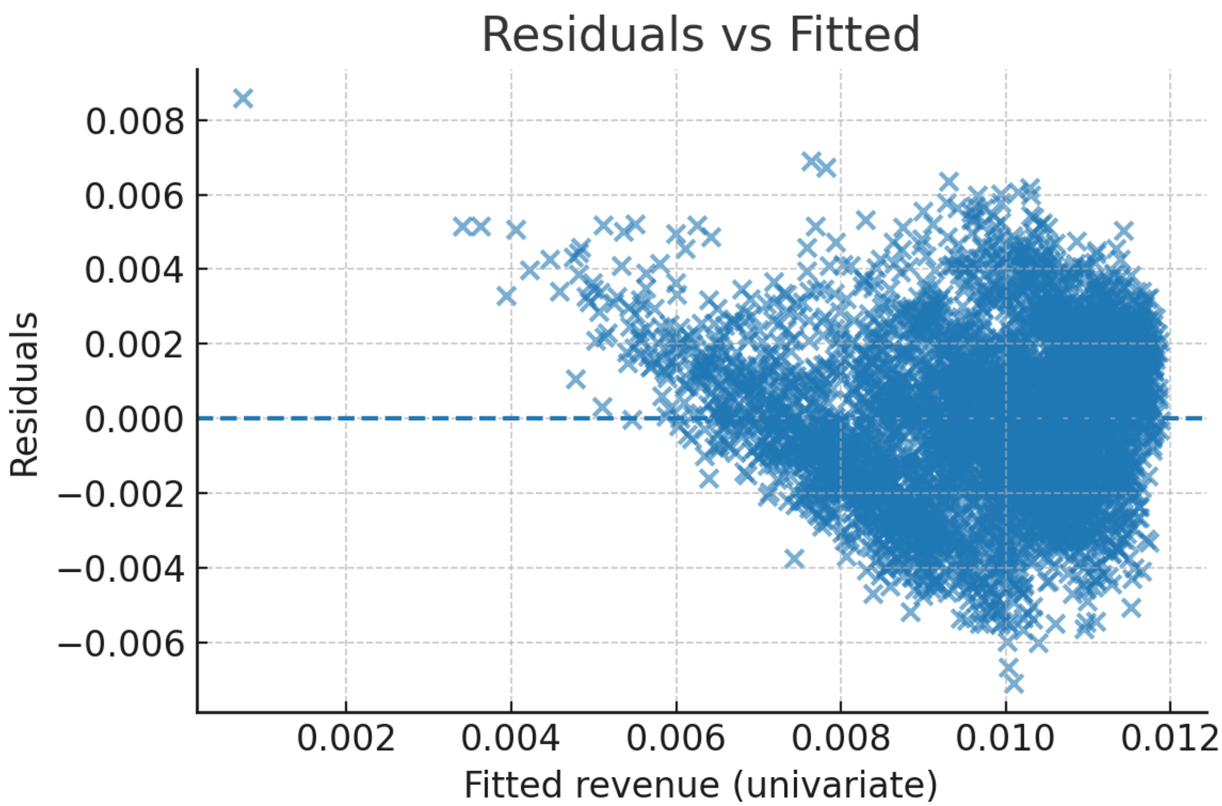
Revenue vs. Time on Page. Line shows fitted relationship; shaded region is a 95% interval. Dashes show a smoothing curve to reveal nonlinearity.



Adjusted relationship (holding other variables at typical values).



Residuals vs. Fitted (diagnostic for simple model).



Method (Brief)

We assessed correlation (Pearson and Spearman) and fit simple and adjusted linear models. Adjusted models include numeric controls as-is and encode low-cardinality categoricals. Uncertainty uses robust (HC3) standard errors. We visualize both unadjusted and adjusted relationships. To make units irrelevant, we also report standardized effects (β) using z-scores.
